

SSO Integration

We at VERIS support SSO integration Using SAML2.0 and OPENID Connect.

Setup

It starts with a request from the client ones confirmed we create a SSO URL and audience URI : SSO URL: <https://client-domain/saml2/idpresponse> (if saml2) Audience URI : urn:amazon:cognito:sp:client-userpoolid

These are to be used at client end to configure their AD.

Request from Client

Along with this we need few things from client side so at the time of Request we request a test user and how the credentials are mapped we basically ask for email and name and how they are mapped.

Client provide

Now Once above things are configured at clients end, we request a **meta data file** or a **url** which point to meta data file. once configured at our end we can test that with test user.

we request to have a coordinated discussions for this integration.
